

SIX WAYS TO SAFETY

- 1) Develop a safe attitude a safe worker thinks about safety and then acts on it. Don't get caught after the fact saying "I just wasn't thinking." Never act without considering the safest way to complete the task.

- 2) Stop, look and listen be aware of your surroundings. What do you see and hear? What machines are in use, is someone working behind you? Look before you turn!

- 3) Take the time to do it right. Those who take pride in their jobs are usually safer than those who rush. Select the right tool for the job and use it properly. It's not worth the risk of injury to rush!

- 4) Keep tools and equipment in good working order. If a tool is not working right ... its dangerous! If there is any concern or evidence that a tool is damaged or not functioning properly, let your supervisor or manager know IMMEDIATELY.

- 5) Anticipate problems before they occur. If you see a potentially dangerous situation do something about it! Don't wait until somebody gets hurt. Don't wait to be asked to fix a dangerous situation Take initiative. The person you save from injury may be you.

- 6) Follow the Rules. Most accidents can be avoided if everyone follows the rules. Horseplay can put you and others in danger. Never use tools that you have been instructed to operate unless you are trained on their use.

*Safety is as simple as ABC..... Always **Be Careful***
